

Parallel and Perpendicular Lines in the Coordinate Plane NOTES

Parallel lines have Same slope.

Draw an example of parallel lines. Give an equation for each of your lines.

$$y = \frac{2}{3}x - 6$$

$$y = \frac{2}{3}x + 2$$

Perpendicular lines have opposite reciprocal slope.

What does this mean? opposite sign + flipped fraction

$$\frac{3}{1} + -\frac{1}{3} \quad \frac{3}{4} + -\frac{4}{3}$$

*Note: The product of perpendicular line slopes is -1

Draw an example of perpendicular lines. Give an equation for each of your lines.

$$y = 3x + 2$$

$$y = -\frac{1}{3}x + 1$$

For each slope given, identify what slope the parallel and perpendicular line would have.

slope	parallel	perpendicular
$\frac{4}{3}$	$\frac{4}{3}$	$-\frac{3}{4}$
$-\frac{2}{5}$	$-\frac{2}{5}$	$\frac{5}{2}$
5	5	$-\frac{1}{5}$
-1	-1	1
0	0	undefined
$\frac{a}{b}$	$\frac{a}{b}$	$-\frac{b}{a}$

Are the following lines parallel perpendicular or neither? How do you know?

1. $y = 1x + 5$, $y = 1x + 1$

neither

2. $y = -1x + 5$, $y = 1x - 8$

perpendicular

3. $y = 1x + 1$, $y = 1x + 2$

perpendicular

4. $y = 1x$, $y = 4 + 1x$

parallel

What would lines that are neither parallel nor perpendicular look like?

Intersecting lines

Write the equation of a line that is parallel AND a line that is perpendicular to a given line through the given point.

1. $y = -2x - 5$, $(-1, 4)$

parallel
slope: -2 $(-1, 4)$

$$y = -2x + b$$

$$4 = -2(-1) + b$$

$$4 = 2 + b$$

$$2 = b$$

$$y = -2x + 2$$

perpendicular
slope: $\frac{1}{2}$ point $(-1, 4)$

$$y = \frac{1}{2}x + b$$

$$4 = \frac{1}{2}(-1) + b$$

$$4 = -\frac{1}{2} + b$$

$$4.5 = b$$

$$y = \frac{1}{2}x + 4.5$$

2. $y = 3x$ $(3, 6)$

parallel
slope: 3 $(3, 6)$

$$y = 3x + b$$

$$6 = 3(3) + b$$

$$6 = 9 + b$$

$$-3 = b$$

$$y = 3x - 3$$

perpendicular
slope: $-\frac{1}{3}$ $(3, 6)$

$$y = -\frac{1}{3}x + b$$

$$6 = -\frac{1}{3}(3) + b$$

$$6 = -1 + b$$

$$7 = b$$

$$y = -\frac{1}{3}x + 7$$

3. $y = \frac{3}{4}x - 2$, $(0, 5)$ ~~parallel~~ perpendicular

$$y = -\frac{4}{3}x + b$$

$$5 = -\frac{4}{3}(0) + b$$

$$5 = b$$

$$y = -\frac{4}{3}x + 5$$

4. $y = -10x + 8$, $(\frac{1}{2}, \frac{1}{2})$ parallel

$$y = -10x + b$$

$$\frac{1}{2} = -10(\frac{1}{2}) + b$$

$$\frac{1}{2} = -5 + b$$

$$5\frac{1}{2} = b$$

$$y = -10x + 5.5$$

5. ~~$7y = 4x + 1$~~ , $(28, 2)$ perpendicular

6. ~~$6y = 1x - 128$~~ , $(10, 24)$ perpendicular
